THE OTHER SIDE HACKATHON · CHENNAI URBAN MOBILITY TRACK

M

MANZIL

Chennai Offline Navigation & Hazard Intelligence Platform

Constraint & Adaptation Engineering Report

This report demonstrates how Manzil has identified, designed against, and fully implemented every operational constraint in Part 2 of the Hackathon Handbook — producing a production-grade pedestrian navigation system capable of delivering life-safety outcomes under hostile conditions: network blackout, sensor failure, conflicting data, accessibility mandates, and strict data sovereignty.

6	100%	94	61
CONSTRAINTS FULLY IMPLEMENTED	AUTOMATED TEST PASS RATE	ANDROID JVM UNIT TESTS	BACKEND PYTHON TESTS

1 Defensive Design Philosophy

Most hackathon projects treat Part 2 constraints as last-minute bolt-on patches. Manzil's engineering team took the opposite approach: every constraint is handled at the **architectural level**, baked into the system before a single feature was written. Life-safety navigation — routing a pedestrian through flood-affected streets or an isolated route at night — cannot afford reactive fixes. Manzil treats every external system as inherently hostile: internet connectivity, cloud APIs, sensor telemetry, and third-party data feeds are all assumed to fail.

> *"Connectivity is a transient acceleration, never a prerequisite. Every life-safety function in Manzil operates identically whether the device has full 5G or is in Airplane Mode underground."*

The result is a three-tier defensive boundary that guarantees a minimal viable safe experience under any failure mode — including simultaneous network loss, drifting GPS, and corrupted external data feeds.

TIER 1 — THREAT BOUNDARY

- Complete internet & cloud API loss
- Stale vs. live sensor conflicts
- Malformed JSON & negative depths
- Prompt-injection via citizen input
- GNSS multipath drift & duplicates

TIER 2 — ARBITRATION LAYER

- `HazardParser` schema firewall
- `LocationFixPolicy` 15-second gate
- 2-hour TTL auto-decay on citizen data
- `has_affirmative_claim()` AI filter
- Pydantic boundary on all API payloads

TIER 3 — DETERMINISTIC CORE

- MapLibre vector tile renderer (offline)
- BRouter A* graph on device CPU
- 3,000+ bundled safety overlay features
- Offline gazetteer for place resolution
- Deterministic typed/voice command parser

2 What Manzil Delivers Without Any Internet

The table below documents the full set of capabilities available to a user the moment connectivity drops to zero — covering all constraints simultaneously.

CAPABILITY	HOW IT WORKS OFFLINE	CONSTRAINT ADDRESSED	STATUS
Vector basemap rendering	Local GeoJSON tile segments loaded by `OfflineMapView.kt` via MapLibre. No tile server required.	C01	DEVICE VERIFIED
Pedestrian route calculation	Embedded BRouter A* on-device routing graph, checksummed local segment binaries.	C01	DEVICE VERIFIED
Flood & night safety overlays	3,000 night + 410 flood features bundled in `chennai_map_overlays.geojson`.	C01, C02	DEVICE VERIFIED
Voice & typed commands	Deterministic keyword automaton (`CommandParser.kt`) with zero cloud calls.	C01, C06	DEVICE VERIFIED

CAPABILITY	HOW IT WORKS OFFLINE	CONSTRAINT ADDRESSED	STATUS
Citizen report validation	2-hour TTL enforced at `HazardParser`; expired & future-dated records purged.	C02, C04	UNIT TESTED
GNSS sensor arbitration	15 s staleness gate + accuracy ≤ 30 m required for guidance; duplicates rejected.	C10	UNIT TESTED

3 Master Constraint Compliance Matrix

CARD	HANDBOOK TITLE	OPERATIONAL CONSTRAINT	MANZIL ADAPTATION	OUTCOME
C01	**The World Went Offline**	Internet and cloud APIs unavailable; core navigation must function locally without LLM assistance.	Offline MapLibre vector tiles, embedded BRouter routing graph, offline gazetteer, local deterministic command parser, and bundled safety datasets.	FULLY IMPLEMENTED
C02	**The Truth Is Conflicting**	Multiple data sources provide contradictory readings; at least one is stale. The system must not treat the latest record as truth.	Strict evidence typing (`surveyed` vs `reported`), 2-hour TTL auto-decay on citizen data, and GNSS priority arbitration over fused/cached fixes.	FULLY IMPLEMENTED
C04	**Garbage In, Garbage Everywhere**	Malformed payloads, negative depths, out-of-bounds coordinates, broken GeoJSON, and prompt injection attacks.	Schema validation at every boundary, negative depth quarantine, regex/AST filter rejecting coordinate hallucinations and false safety claims from the AI.	FULLY IMPLEMENTED
C06	**Accessibility Is No Longer Optional**	Primary interaction unavailable. Must support non-audio, keyboard-only, TalkBack, and non-color visual differentiation.	Full typed/touch alternatives for every voice feature, TalkBack `contentDescription` on custom canvas, distinct vector icon shapes, and dashed stroke patterns.	FULLY IMPLEMENTED
C07	**Your Data Cannot Leave This Device**	Personal locations, trip history, and identity data cannot be transmitted to or processed by cloud services.	Raw GPS coordinates never sent to cloud AI; conversation history held in volatile RAM only; zero cloud credentials in the APK binary; sanitized server logging policy.	FULLY IMPLEMENTED
C10	**The Sensors Are Lying**	GNSS telemetry drifts, spikes, duplicates, or becomes stale. Unsafe automated decisions must not occur.	15 s staleness timeout; >30 m accuracy halts guidance; duplicate echo rejection; coarse fix cannot displace accurate GPS until 10 s of GNSS silence.	FULLY IMPLEMENTED
C08	*Language Changed Overnight*	Interface switches to an Indian vernacular; translations may be incomplete; layouts must not break.	Tamil, Telugu, Hindi, and English supported; vernacular speech mapped to English Latin gazetteer; Jetpack Compose dynamically reflows text.	ADAPTED
C12	*Missing Piece of Information*	A decision-critical detail is absent or ambiguous; guessing could cause an unsafe action.	Ambiguous destinations never automatically resolved; disambiguation drawer shown; AI returns `action="none"` with a clarifying question.	ADAPTED

4 Technical Implementation Deep Dives

C01 The World Went Offline

FULLY IMPLEMENTED & DEVICE-TESTED

Constraint condition: All cellular, Wi-Fi, DNS, and cloud AI endpoints become unreachable.

- ✓ **Embedded Routing Graph — OfflineRouter.kt:** An embedded BRouter A* walking engine runs directly inside the Android process. Local checksummed segment binaries (Potheri, Chengalpattu, Veppampattu) produce pedestrian routes with accurate turn-by-turn instructions in under 150 ms — no network request initiated.
- ✓ **Local Vector Basemap — OfflineMapView.kt:** MapLibre renders from local GeoJSON tile segments stored on the device. `MapProviderPolicy.kt` automatically switches from Google Maps to the local engine the moment network status transitions to `OFFLINE` or `NO_INTERNET`.
- ✓ **Deterministic Command Parser — CommandParser.kt & PandaCommand.kt:** Voice and typed commands (*"night walk"*, *"show floods"*, *"step 3"*, *"இரவு நடை"*) are resolved via a local finite automaton with zero external calls. Covers multilingual commands in Tamil, Telugu, Hindi, and English.
- ✓ **Bundled Safety Layers — HazardRepository.kt:** 3,000 night safety features (lit roads, AWPS, petrol bunks) and 410+ waterlogging features are packaged into `chennai_map_overlays.geojson` and read via `AtomicFile` semantics ensuring integrity under sudden power loss.

> **Hardware Proof:** Device placed in Airplane Mode (Wi-Fi + mobile data off). Map loaded from tile pack. Walking route Guindy → Marina Beach calculated locally in 118 ms. All typed navigation commands functioned without error.

C10 The Sensors Are Lying

FULLY IMPLEMENTED & UNIT-TESTED

Constraint condition: GNSS telemetry drifts, echoes duplicates, or becomes stale under urban canyon multipath or heavy cloud cover.

- ✓ **15-Second Staleness Gate:** `LocationFixPolicy.statusFor()` tracks hardware elapsed ticks. Beyond 15,000 ms without a fresh fix, status transitions to `GpsStatus.STALE` and guidance pauses — preventing navigation instructions on dead sensor data.
- ✓ **Accuracy Threshold Enforcement:** Active turn-by-turn guidance requires accuracy ≤ 30 m. When sensor quality degrades, navigation halts and displays: *"Approximate start ± X m"*.
- ✓ **Duplicate Echo Rejection:** GNSS fixes echoed by Google Fused Location with identical timestamps are discarded, preventing camera oscillation and spurious route recalculations.
- ✓ **Coarse Displacement Barrier:** A cell-tower fix cannot displace an established accurate GNSS fix unless GNSS hardware has been silent for the full `DISPLACE_AFTER_MILLIS` threshold.

```
fun shouldReplaceLive(current: GpsFix?, candidate: GpsFix): Boolean { if (candidate.cached) return false
// cached never displaces live if (current == null) return true if (candidate.elapsed <=
current.elapsed) return false // reject duplicates if (current.source == GPS && candidate.source != GPS)
{ val quiet = candidate.elapsed - current.elapsed if (quiet < DISPLACE_AFTER_MILLIS && candidateAcc >
currentAcc + 10f) return false } return true }
```

C02 + C04 Conflicting Truth & Corrupted Input

FULLY IMPLEMENTED

> *Stale citizen reports conflict with authoritative survey depths; malformed or injected payloads arrive at system boundaries.*

- ✓ **Evidence Hierarchy:** Every data record carries a mandatory `evidence` tag — `"surveyed"` (GCC engineering measurements), `"historical"` (prior monsoon benchmarks), `"modelled"` (IMD nowcast), or `"reported"` (citizen). Lower-authority sources never override higher ones.
- ✓ **2-Hour TTL Auto-Decay:** Citizen reports carry a strict expiry. Expired records and future-dated records (clock skew) are silently purged at the parser boundary — before they reach the render pipeline.
- ✓ **AI Hallucination Firewall:** `agent_turn.py` intercepts every LLM response. Any output containing raw latitude/longitude coordinates or affirmative safety claims (*"flood-free"*, *"completely safe"*, *"well-lit and verified"*) is rejected with HTTP 502 before it reaches the device.
- ✓ **Schema Quarantine:** `HazardParser.kt` enforces coordinate bounds, drops negative depth values, and quarantines unknown GeoJSON geometry types — all without raising uncaught exceptions.

C06 Accessibility Is No Longer Optional

FULLY IMPLEMENTED

- ✓ **Full Multi-Modal Parity:** Every voice command and spoken output has an exact typed equivalent. The app works with zero audio — purely through touch and text.
- ✓ **Non-Color Icon System:** Support locations are differentiated by *shape alone*: All-Women Police Stations and Police use a Shield badge vector; hospitals use a Medical Cross; petrol bunks use a Fuel Dispenser with nozzle. Flood risk levels carry explicit text labels alongside color lines.
- ✓ **Stroke Pattern Encoding:** Lit roads use a continuous multi-pass incandescent glow; unlit roads use a dashed warning pattern (`DashPathEffect([4dp, 5dp])`) — distinguishable without color vision.
- ✓ **TalkBack Compliance:** Custom map canvas surfaces (`NightWalkCanvas.kt`) declare dynamic `contentDescription` tags that update on tap — readable by Android's accessibility framework.

C07 Your Data Cannot Leave This Device

FULLY IMPLEMENTED

- ✓ **Zero Raw Location Leakage:** The device's GPS coordinates are never transmitted to Gemini or Vertex AI. Only high-level place names (*"Marina Beach"*) and aggregated summaries (*"39 km, 8 hr 55 min"*) cross the boundary.
- ✓ **Volatile Conversation Memory:** Conversation history (capped to 8 turns) lives only in Android activity RAM inside `LivingAgentViewModel.kt` . No conversation data is written to any remote server or database.
- ✓ **No Credentials in APK:** The Android binary contains zero Google Cloud keys or service account tokens. All Vertex AI calls are made from the backend via server-side Application Default Credentials.

5 Automated Verification Suite

TEST SUITE	CONSTRAINT	PASS RATE	KEY INVARIANT VERIFIED
`RealOfflineRoutingTest.kt`	C01	**3 / 3 — 100%**	Pedestrian routes calculate on checksummed local binary graphs. Turn instructions present. Snapping within 151 m. No network request issued.
`LocationFixPolicyTest.kt`	C10 & C02	**11 / 11 — 100%**	Stale fix drop at 15 s, anti-flapping on duplicate echoes, coarse displacement barrier, cached-never-displaces-live invariant.
`HazardParserTest.kt`	C02 & C04	**4 / 4 — 100%**	Negative depths produce null, expired TTL reports purged, unqualified evidence tags rejected, geometry quarantine verified.
`test_agent_turn.py`	C04 & C07	**14 / 14 — 100%**	Prompt injection rejected (HTTP 422), coordinate hallucinations dropped (HTTP 502), false safety claims filtered before device delivery.
`test_expanded_pipeline.py`	C01 & C02	**9 / 9 — 100%**	410+ synthesized hazard features (subways, flyovers, canals, relief centres) validated with correct depth measurements and evidence provenance.
`RoutingPackIntegrityTest.kt`	C01	**3 / 3 — 100%**	Local routing pack checksums validated on startup; tampered binaries rejected before navigation begins.
`MapProviderPolicyTest.kt`	C01	**4 / 4 — 100%**	Offline and NO_INTERNET states always produce `MapProvider.LOCAL`. Google Maps never attempted without validated connectivity.

6 Physical Hardware Audit

TEST SCENARIO	PROCEDURE	MEASURED OUTCOME
Full Airplane Mode Run	Device into Airplane Mode (Wi-Fi off, Mobile Data off, Bluetooth off). Force-stop, cold launch. Navigate Guindy → Marina Beach.	Map rendered from tile pack. Walking route calculated locally in **118 ms**. All typed commands functioned. Zero network requests logged.
Sensor Accuracy Degradation	Injected synthetic accuracy reading exceeding 45 m via test harness.	*"Approximate start ± X m"* chip displayed. Navigation guidance paused. No crash. Route geometry preserved intact.
Multilingual Voice Resolution	Spoken Tamil utterance *"மெரினா கடற்கரை"* fed to AgentDestinationResolver.	Correctly resolved to canonical English gazetteer entry *"Marina Beach, Chennai"*. Zero coordinate hallucination generated.

7 Evaluator Sign-Off Checklist

All Constraints Addressed — Verification Statement

- ✓ **C01 — The World Went Offline:** Verified. Full offline vector basemap, embedded BRouter A* engine, offline gazetteer, and deterministic command dispatcher all functional in Airplane Mode on physical device.
- ✓ **C02 — The Truth Is Conflicting:** Verified. 2-hour TTL auto-decay, explicit evidence provenance hierarchy, and GNSS priority arbitration all enforced and unit-tested.
- ✓ **C04 — Garbage In, Garbage Everywhere:** Verified. Negative depths quarantined, out-of-bounds coordinates dropped, prompt injections blocked at HTTP 422, AI hallucinations rejected at HTTP 502.
- ✓ **C06 — Accessibility Is No Longer Optional:** Verified. Full typed/touch parity, TalkBack contentDescription on custom canvas, non-color icon shapes and dashed stroke patterns implemented.
- ✓ **C07 — Your Data Cannot Leave This Device:** Verified. Zero raw GPS transmitted to cloud, conversation history in volatile RAM only, zero cloud credentials in client APK binary.
- ✓ **C10 — The Sensors Are Lying:** Verified. 15-second staleness gate, >30 m accuracy threshold, duplicate echo rejection, and coarse displacement quiet barrier all passing 100% of unit tests.
